

Project Design Phase-II

Data Flow Diagram & User Stories

Date	31 January 2025
Team ID	6ab75aba534c8646a9ce4107
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a visual representation of the information flows within a system. It shows how data enters and leaves the system, what changes the information, and where data is stored. The Level 0 DFD below shows how the UI Policy and Client Scripts control data entry on ServiceNow Incident records.

DFD Level 0: Incident client-side controls

Flow

1. Administrator logs in and creates the **High Impact Control** UI Policy, the Urgency action and the three Client Scripts; the definitions are stored (D1).
2. Agent opens an Incident form. When Impact is 1 - High, the UI Policy makes Assignment group mandatory and Urgency read-only, and reverses both when Impact changes.
3. The onChange script sets Urgency to High and shows an info message when Impact changes to High.
4. On Submit, the onSubmit script blocks the save if Impact is High and Assigned To is empty, and shows an error on the field.
5. The onCellEdit script shows an alert and cancels any State edit made from the list view.
6. Valid records are saved to the Incident table (D2) and a confirmation is returned to the agent.

User Stories

User stories for the Incident client-side controls.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Administrator	UI Policy	USN-1	As an administrator, I can create the High Impact Control UI Policy on the Incident table with the condition Impact is 1 - High and Reverse if false enabled.	The policy is active and applies only when Impact is High.	High	Sprint-1
		USN-2	As an administrator, I can make Assignment group mandatory through the UI Policy when Impact is High.	Assignment group is mandatory for High impact and returns to normal when Impact changes.	High	Sprint-1
		USN-3	As an administrator, I can add a UI Policy Action that makes Urgency read-only when Impact is High.	Urgency stays visible but read-only for High impact; it is editable again otherwise.	High	Sprint-1
	Client Scripts	USN-4	As an administrator, I can add an onChange script that sets Urgency to High when Impact changes to High.	Urgency is set to 1 and an info message is shown.	High	Sprint-2
		USN-5	As an administrator, I can add an onSubmit script that blocks saving when Impact is High and Assigned To is empty.	The record is not saved and an error appears on Assigned To.	High	Sprint-2
		USN-6	As an administrator, I can add an onCellEdit script that blocks State changes from the list view.	An alert is shown and the State value is unchanged.	Medium	Sprint-2
Service Desk Agent	Incident form	USN-7	As an agent, when I set Impact to High, Urgency updates to High automatically and cannot be edited.	Urgency shows High and is read-only after Impact is set to High.	High	Sprint-2
		USN-8	As an agent, I am stopped from saving a High-impact Incident without Assigned To and told why.	Save is blocked and an error message is shown on Assigned To.	High	Sprint-3
		USN-9	As an agent, I can save a High-impact Incident once Assigned To is filled.	The Incident saves without errors.	High	Sprint-3
		USN-10	As an agent, when I lower Impact to Medium, the extra controls are removed and I can save normally.	Assigned To is no longer mandatory, Urgency is editable and the record saves.	Medium	Sprint-3
	Incident list	USN-11	As an agent, I am told State cannot be changed from the list, and I can still change State on the form.	List edit shows an alert and keeps the value; a form update of State saves.	Medium	Sprint-3
Service Delivery Manager	Reporting	USN-12	As a manager, I can rely on Incidents having complete, valid data so reports and SLA tracking are accurate.	High-impact Incidents always carry an owner and a consistent Urgency.	Medium	Sprint-3
