

Project Design Phase
Proposed Solution Template

Date	15 February 2025
Team ID	6ab75aba534c8646a9ce4107
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Incident records need consistent, accurate data for effective triage, routing and resolution, but relying on user awareness and manual checks leads to incomplete or incorrect submissions. This hurts reporting accuracy, SLA compliance and service quality, so field behavior and validation must be enforced at the user-interface level.
2.	Idea / Solution description	Use ServiceNow client-side controls on the Incident form: a UI Policy "High Impact Control" (Impact = 1 - High) makes Assignment group mandatory and Urgency read-only, with Reverse if false enabled. Client Scripts: onChange auto-sets Urgency to High; onSubmit blocks save if Assigned To is empty for High impact; onCellEdit blocks State edits from list view.
3.	Novelty / Uniqueness	Combines a UI Policy with three types of Client Script (onChange, onSubmit, onCellEdit) to cover form, save and list-edit paths. The solution is lightweight, needs no server-side code, reverts automatically when conditions change, and also closes the list-edit loophole.
4.	Social Impact / Customer Satisfaction	Complete and valid incident data speeds up triage and resolution, so end users get faster, more reliable support. Clear on-screen messages guide agents, reducing errors and rework, and improving SLA compliance and overall service quality.
5.	Business Model (Revenue Model)	Delivered as a reusable ServiceNow configuration or consulting package. Revenue comes from one-time implementation fees, customization of business rules per client, and ongoing support and maintenance subscriptions. Organizations save cost through less rework and fewer SLA breaches.
6.	Scalability of the Solution	The same pattern extends to other tables (Change, Problem, Request), other fields and conditions, and can be packaged as an update set or scoped application for deployment across instances. Client-side logic is efficient and adds no load on the server as volume grows.
